## 8.3 Volumes of Solids of Known Cross Sections

#### Volume of a Solid

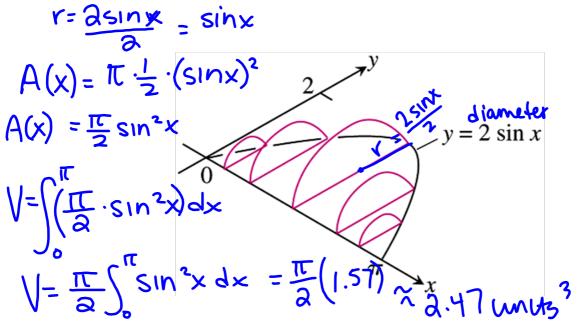

The definition of a solid of known integrable cross section area A(x) from x = a to x = b is the integral of A from a to b,  $V = \int_a^b A(x) dx$ .

# How to find volumes by the method of slicing...

- 1. Sketch the solid and a typical cross section.
- 2. Find a formula for A(x).
- 3. Find the limits of integration.
- 4. Integrate A(x) to find the volume.

### Example - Other Cross Sections

A solid is made so that its base is the shape of the region between the x-axis and one arch of the curve  $y = 2\sin x$ . Each cross section cut perpendicular to the x-axis is a semicircle whose diameter runs from the x-axis to the curve. Find the volume of the solid.

The semicircle at each point x has radius =  $\frac{2 \sin x}{2} = \sin x$ 

and area 
$$A(x) = \frac{1}{2}\pi(\sin x)^2$$
.

So, 
$$V = \frac{\pi}{2} \int_0^{\pi} (\sin x)^2 dx$$
  
 $= \frac{\pi}{2} \text{NINT} ((\sin x)^2, x, 0, \pi)$   
 $= \frac{\pi}{2} (1.570796327)$   
 $= \frac{\pi^2}{4} \text{ in}^3.$ 

### Examples

The base of a solid is the region in the first quadrant enclosed by the graph of  $y = 2 - x^2$  and the coordinate axes. If every cross section of the solid perpendicular to the y-axis is a square the volume of the solid is given by

rewrite in terms of y (solve for x)

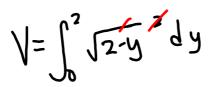

$$(K) \pi \int_0^2 (2 - y)^2 \, dy$$

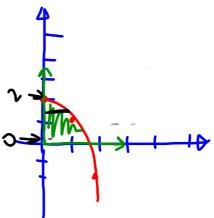

$$(B) \int_0^2 (2-y) \, dy$$

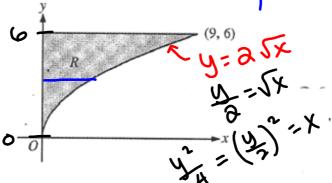

$$(C) \pi \int_0^{\sqrt{2}} (2 - x^2)^2 dx$$

$$(D) \int_0^{\sqrt{2}} (2 - x^2)^2 \, dx$$

$$(\mathbb{E}) \int_0^{\sqrt{2}} (2-x^2) dx$$

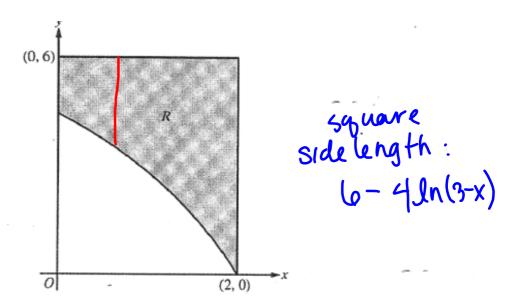

Let R be the region in the first quadrant bounded by the graph of  $y = 2\sqrt{x}$ , the horizontal line y = 6, and the y-axis, as shown in the figure above

(c) Region R is the base of a solid. For each y, where  $0 \le y \le 6$ , the cross section of the solid taken

perpendicular to the y-axis is a rectangle whose height is 3 times the length of its base in region R. Write,

but do not evaluate, an integral expression that gives the volume of the solid.

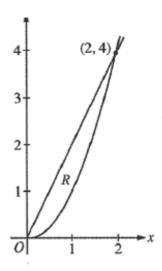

$$V = \int_{0}^{6} \left(\frac{3y^{2}}{4}\right) \left(\frac{y^{2}}{4}\right) dy = \int_{0}^{6} \frac{3y^{4}}{10} dy$$

In the figure above, R is the shaded region in the first quadrant bounded by the graph of  $y = 4\ln(3 - x)$ , the horizontal line y = 6, and the vertical line x = 2.

(c) The region R is the base of a solid. For this solid, each cross section perpendicular to the x-axis is a square. Find the volume of the solid.

$$V = \int_{0}^{2} [6-42n(3-x)]^{2} dx = 26.27 \text{ units}^{3}$$

Let R be the region in the first quadrant enclosed by the graphs of y = 2x and  $y = x^2$ , as shown in the figure above.

- (b) The region R is the base of a solid. For this solid, at each x the cross section perpendicular to the x-axis has area  $A(x) = \sin\left(\frac{\pi}{2}x\right)$ . Find the volume of the solid.
- (c) Another solid has the same base R. For this solid, the cross sections perpendicular to the y-axis are squares. Write, but do not evaluate, an integral expression for the volume of the solid.
